

The purpose of this lab is to build on Lab 3 by introducing text fields and buttons for user interaction using Jetpack Compose. The completed application will contain a single button and a text field for the user to enter their name. When the button is pressed, it will display a personalized greeting containing the users name and single random Bible verse (book, chapter, verse and text). The greeting will display the appropriate message based on the current system time using the following criteria.

- 3am until noon – “Good morning <user>, here is your random Bible verse”
- Noon until 5pm - “Good afternoon <user>, here is your random Bible verse”
- 5pm until 3am – “Good evening <user>, here is your random Bible verse”

Replace <user> with the name that was entered into the text field by the user.

You can refer to the code example below on how to query the current system time.

```
import java.util.Date
import java.text.SimpleDateFormat

fun main() {
    //obtain the current system date
    val currentDate = Date()
    //create a date format object that will extract only the hour field
    val dateFormat = SimpleDateFormat("HH")
    //extract the current hour from the date
    val currentHour = dateFormat.format(currentDate)
    //convert the current hour into an integer
    val intHour = currentHour.toInt()
    println("Current Hour: $intHour")
}
```

To determine the correct time of day for the greeting, use a separate function that doesn't accept any parameters and returns a string of “morning”, “afternoon”, or “evening”, depending on the time. The returned value should then be concatenated to the greeting using string interpolation and displayed to the user.

Comp 322  
Mobile Application Development  
Lab 4 Android Studio and Jetpack Compose with User Interaction

As with Lab 3, this lab will use the BibleVerse and VerseOfTheDay classes that we created in Lab 2 (see Lab 2 requirements).

The lab report should contain a brief description of what the lab does followed by screen images of the source code and successful execution. The lab report should also contain an explanation of any problems encountered while completing the lab, and the estimated time for completion. Submit the lab report along with the source code to Canvas by the due date. If you have any questions, please ask.
