Lab 5 Jetpack Compose ViewModel

The purpose of Lab5 is to modify Lab 4 to include a Jetpack Compose ViewModel. The completed application will function similarly to lab 4. However, it will now store the Composeable's state within a ViewModel so that it can survive configuration changes. None of the composables should access the BibleVerse class or VerseOfTheDay classes directly.

The function to display the custom greeting should be placed within the ViewModel and it should return a formatted string based on the current time and the entered name (see lab 4). The ViewModel's constructor should call the VerseOfTheDay method that returns a random Bible object. There should be a method within the ViewModel class that returns a formatted string of the scripture's location based on the format – Book Ch:V (example: Romans 8:28). This formatted string will be used to populate a Text composeable within the application.

The lab report should contain a brief description of what the lab does followed by screen images of the source code and successful execution. The lab report should also contain an explanation of any problems encountered while completing the lab, and the estimated time for completion. Submit the lab report along with the source code to Canvas by the due date. If you have any questions, please ask.
